Instructions for submitting your solution:

- The solutions **should be typed** and we cannot accept hand-written solutions. Here's a short intro to Latex.
- You should submit your work through **Gradescope** only.
- If you don't have an account on it, sign up for one using your CU email. You should have gotten an email to sign up. If your name based CU email doesn't work, try the identikey@colorado.edu version.
- Gradescope will only accept **.pdf** files (except for code files that should be submitted separately on Gradescope if a problem set has them) and **try to fit your work in the box provided**.
- You cannot submit a pdf which has less pages than what we provided you as Gradescope won't allow it.
- Verbal reasoning is typically insufficient for full credit. Instead, write a logical argument, in the style of a mathematical proof.
- For every problem in this class, you must justify your answer: show how you arrived at it and why it is correct. If there are assumptions you need to make along the way, state those clearly.
- You may work with other students. However, **all solutions must be written independently and in your own words**. Referencing solutions of any sort is strictly prohibited. You must explicitly cite any sources, as well as any collaborators.

1. (25 pts) For this question, you are going to implement Kruskal's algorithm and union-find to build an MST from supplied data. Refer to the python starter code **MST_Q1_starter_code.py** on Canvas that generates a graph of US cities, where the cities are the vertices and the edges are the distances between them. The code requires **miles_dat.txt.gz** file as the graph data source so keep it in the same folder as the code. Before you start writing any code, make sure you can build the code that's been supplied. The code uses the `networkx` library. You may need to install this library for the code to run.

Read all instructions for this question carefully.

- (a) (5 pts) Complete the code to find the edges that are part of the MST. You should add these edges in the list `kruskal_selected_edges`. Do not change the existing format of the edges. They are represented as a tuple of vertices and a vertex is represented like `v = "Waukegan, IL"`. Read the comments in the code for more information. You don't need to read/understand the `miles_graph()` and `draw_graph()` functions.
- (b) (10 pts) Implement the `union()` function to implement Kruskal's.
- (c) (10 pts) Modify your code slightly so that you can produce disconnected components. Let's call these components clusters. The "spacing" of any particular clustering (group of clusters) is defined as the smallest edge between vertices in any pair of different clusters. If we stop Kruskal's k iterations before the algorithm completes, what is the spacing value? Run your code for $k = 2 \dots 10$ to generate spacing for all these k values. Your code needs to have this calculation for your answer to receive credit.
- (d) In the pdf that you submit for this assignment, please include the following:
 - i. One of the generated graphs **MST.png** that your code produces that shows the MST for that run. Note that on each run, you can get a different number of edges to begin with. Thus, you can expect a different answer each time you run.
 - ii. The spacing values for each k value that you use.
 - iii. Your `.py` file for this question needs to be submitted to Canvas.

2. (3 pts) How many disconnected components are there when you stop Kruskal's k round before you complete the MST? Justify your answer.

Solution. $k + 1$ because for two disconnected clusters there is one connection so that would leave 1 iteration left before completion.

3. (5 pts) Consider the recurrence $F_n = 2F_{n-1} + F_{n-2}$, with the base cases $F_0 = 1$ and $F_1 = 2$. Suppose we have letters v_0, \dots, v_7 ; where for $i \in \{0, \dots, 7\}$, the frequency of v_i is given by F_i . Draw a Huffman tree for v_0, \dots, v_7 .

Solution. $v_0 = 1$

$$v_1 = 2$$

$$v_2 = 5$$

$$v_3 = 12$$

$$v_4 = 29$$

$$v_5 = 70$$

$$v_6 = 169$$

$$v_7 = 408$$

4. (5 pts) Assume you run your Huffman tree algorithm and you produce the following pre-fix codes. Describe why there must be an error in your algorithm.

S = 00
c = 01
i = 001
e = 011
n = 101

Solution. 01101 = c,n or e,c
that is not allowed. There are more examples but this counter example is sufficient for showing there is ambiguity in the coding scheme.

5. (10 pts) Assume you're given an integer matrix that represents a plot of land, where the value at that location in the matrix represents the height above sea level. A value of zero indicates water. A pond is a region of water connected vertically, horizontally, or diagonally. The size of the pond is the total number of connected water cells. Write an algorithm to compute the sizes of all ponds in the matrix.

Example:

```
0 2 1 0
0 1 0 1
1 1 0 1
0 1 0 1
```

would output 1, 2, 4.

- (a) (3 pts) Describe the graph data structure that your algorithm will use for this problem.

Solution. I have no idea, I would think that it works something like Huffman encoding

- (b) (2 pts) Provide a 3-4 sentence description of how your algorithm works, including how the matrix is converted to the graph, how adjacent vertices are identified, and how the algorithm traverses the graph to identify connected vertices.

Solution. I think it would work kind of like huffman encoding but at this point I don't know because I have tried a bunch of different options and nothing really seems to work. I was thinking something huffman encoding would have a chance of grouping the ponds but there are a bunch of problems with that where the algorithm either can't build a tree or it doesn't get to all points.

- (c) (5 pts) Write an algorithm to solve this problem.

Solution. pfft, your guess is as good as mine.
